

VEHICLE AUDIO ADAPTER
ABSTRACT OF THE DISCLOSURE

An audio adapter is used with a vehicle audio system
5 including a power amplifier, a head unit serving as a tuner, and
a plurality of loud speakers mounted in a vehicle compartment.
The audio adapter includes a transformer provided for every one
channel between a non-genuine head unit and the power amplifier
when the head unit is replaced by the non-genuine head unit. The
10 transformer matches an output impedance with an input impedance
between the non-genuine head unit and the power amplifier. The
transformer adjusts an output level of the non-genuine head unit
to an input level of the power amplifier.
